Comment: Practical oriented

What is a Network?

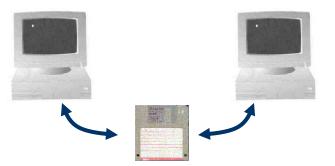

A <u>network</u> consists of 2 or more computers connected together, and they can <u>communicate</u> and share resources (e.g. information)

Why Networking?

- Sharing information i.e. <u>data communication</u>
 - Do you prefer these?

• Or this?

Sharing hardware or software

• E.g. print document

- Centralize administration and support
 - E.g. Internet-based, so everyone can access the same administrative or support application from their PCs

How many kinds of Networks?

- Depending on one's perspective, we can classify networks in different ways
 - Based on transmission media: Wired (UTP, coaxial cables, fiber-optic cables) and Wireless
 - Based on network size: LAN and WAN (and MAN)
 - Based on management method: Peer-to-peer and Client/Server
 - Based on topology (connectivity): Bus, Star, Ring ...

[•]

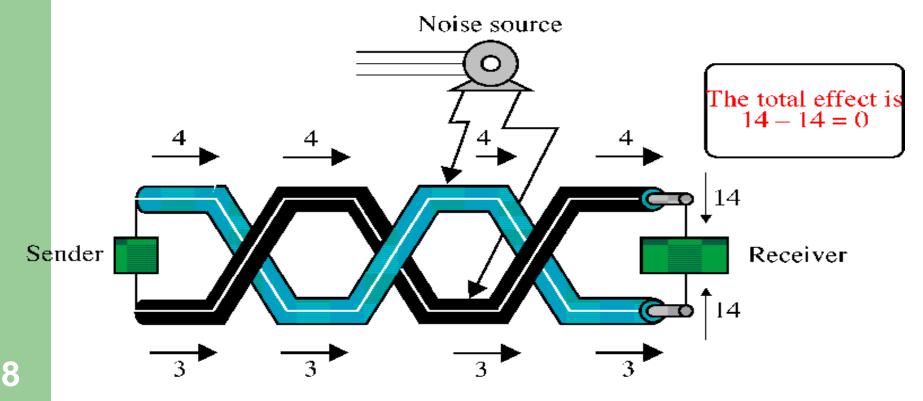

Transmission Media

- Two main categories:
 - Guided wires, cables
 - Unguided wireless transmission, e.g. radio, microwave, infrared, sound, sonar
- We will concentrate on guided media here:
 - Twisted-Pair cables:
 - > Unshielded Twisted-Pair (UTP) cables
 - Shielded Twisted-Pair (STP) cables
 - Coaxial cables
 - Fiber-optic cables

Twisted-Pair Cables

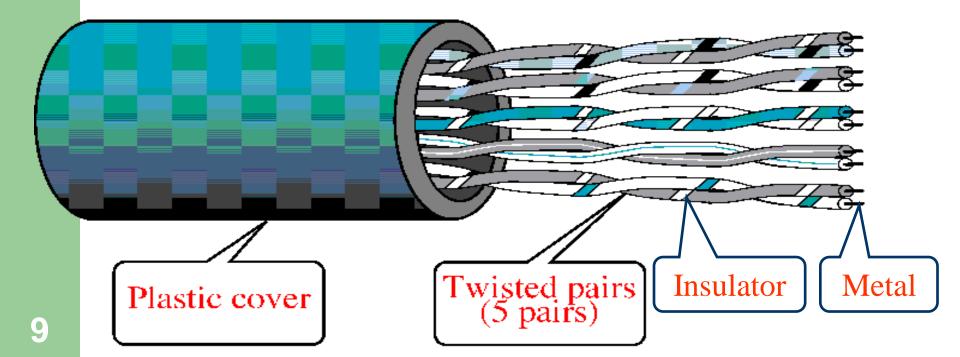

• If the pair of wires are not twisted, electromagnetic noises from, e.g., motors, will affect the closer wire more than the further one, thereby causing errors

Unshielded Twisted-Pair (UTP)

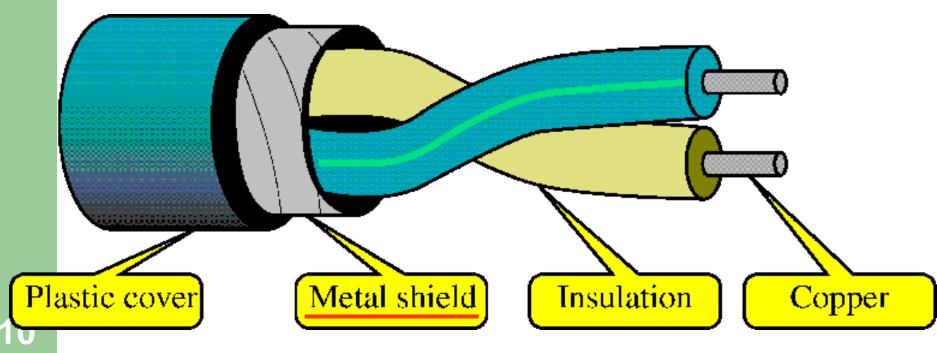

- Typically wrapped inside a plastic cover (for mechanical protection)
- A sample UTP cable with 5 unshielded twisted pairs of wires

Shielded Twisted-Pair (STP)

 STP cables are similar to UTP cables, except there is a metal foil or braided-metal-mesh cover that encases each pair of insulated wires

Categories of UTP Cables

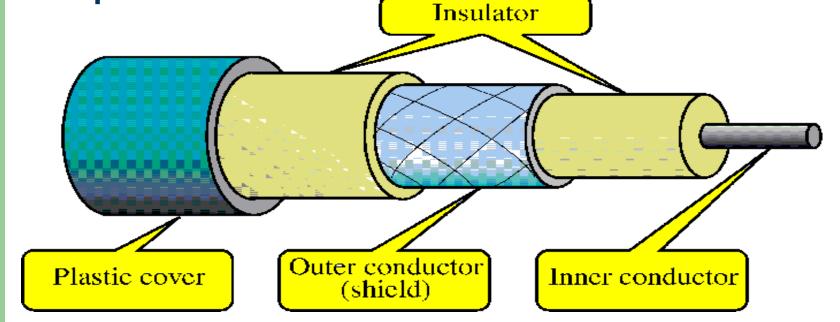

EIA classifies UTP cables according to the quality:

- Category 1 the lowest quality, only good for voice, mainly found in very old buildings, not recommended now
- Category 2 good for voice and low data rates (up to 4Mbps for low-speed token ring networks)
- Category 3 at least 3 twists per foot, for up to 10 Mbps (common in phone networks in residential buildings)
- Category 4 up to 16 Mbps (mainly for token rings)
- Category 5 (or 5e) up to 100 Mbps (common for networks targeted for high-speed data communications)
- Category 6 more twists than Cat 5, up to 1 Gbps

Coaxial Cables

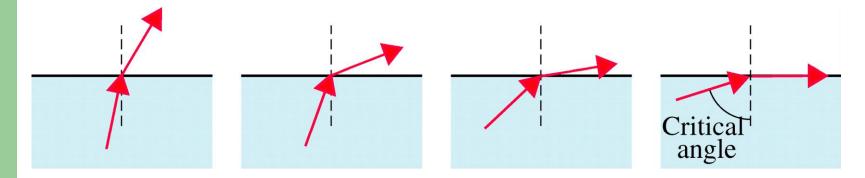

- In general, <u>coaxial cables</u>, or <u>coax</u>, carry signals of higher freq (100KHz–500MHz) than UTP cables
- Outer metallic wrapping serves both as a shield against noise and as the second conductor that completes the circuit

Fiber-Optic Cables

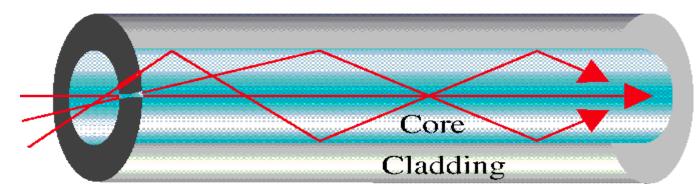

- Light travels at <u>3×10⁸ ms⁻¹</u> in free space and is the fastest possible speed in the Universe
- Light slows down in denser media, e.g. glass
- <u>Refraction</u> occurs at interface, with light bending away from the normal when it enters a less dense medium

• Beyond the <u>critical angle</u> \Rightarrow total internal reflection

- An optical fiber consists of a <u>core</u> (denser material) and a <u>cladding</u> (less dense material)
- Simplest one is a multimode step-index optical fiber
- <u>Multimode</u> = multiple paths, whereas <u>step-index</u> = refractive index follows a step-function profile (i.e. an abrupt change of refractive index between the core and the cladding)
- Light bounces back and forth along the core
- Common light sources: LEDs and lasers

Advantages and Disadvantages

- Over the second seco
- Less signal attenuation a signal can run for miles without regeneration (currently, the lowest measured loss is about ~4% or 0.16dB per km)
- Higher bandwidth currently, limits on data rates come from the signal generation/reception technology, not the fiber itself
- ⊗ Cost Optical fibers are expensive

15

Installation/maintenance — any crack in the core will degrade the signal, and all connections must be perfectly aligned

LAN and WAN

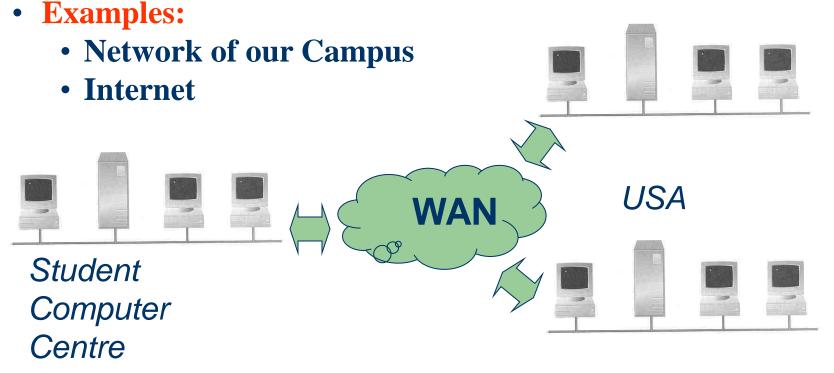

- Local Area Network (LAN)
 - Small network, short distance
 - A room, a floor, a building
 - Limited by no. of computers and distance covered
 - Usually one kind of technology throughout the LAN
 - Serve a department within an organization
 - Examples:
 - Network inside the Student Computer Room
 - Network inside CF502
 - Network inside your home

• Wide Area Network (WAN)

- A network that uses long-range telecommunication links to connect 2 or more LANs/computers housed in different places far apart.
 - Towns, states, countries

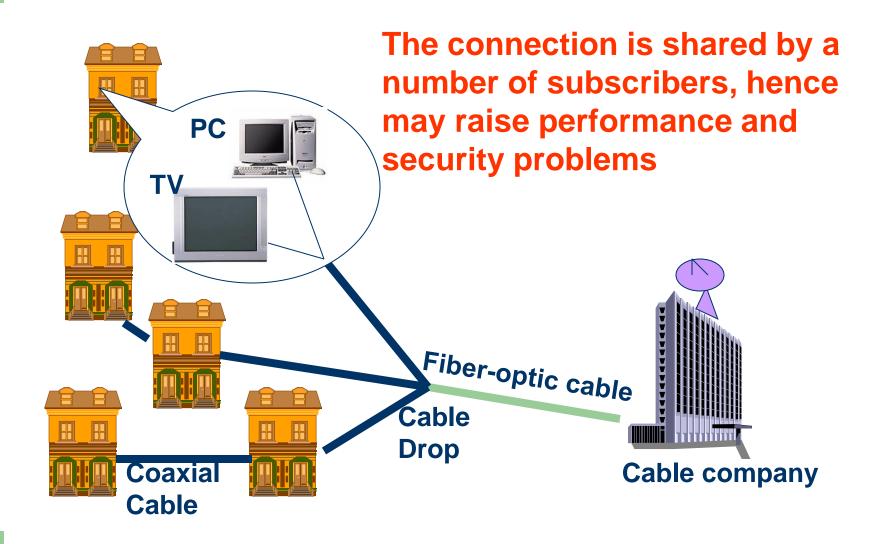

• Example WAN technologies:

- ISDN Integrated Service Digital Network
 - Basic rate: 192 Kbps Primary rate: 1.544Mbps
- **T-Carriers** basically digital phone lines
 - T1: 1.544Mbps T3: 28×T1
- Frame relay
 - Each link offers 1.544Mbps or even higher
- ATM Asynchronous Transfer Mode
 - Support B-ISDN: 155Mbps or 622Mbps or higher
- **SONET** Synchronous Optical Network
 - Basic rate OC1: 51.84Mbps
 - Support OC12 and up to OC192 (9953.28Mbps) or even higher in the future

- Example of WAN: Broadband Cable Network
 - Cable TV services have been extensively developed in most modern cities
 - Cable TV companies try to make use of their coaxial cable installed (that are supposed to carry TV signals) to deliver broadband data services
 - Many cable network wiring has been replaced with hybrid fiber-coax (HFC) — i.e. use of fiber-optic cable to connect to the subscribers' buildings, and then the original coaxial cable to connect to each household

ENG224 INFORMATION TECHNOLOGY – Part II 5. Introduction to Networking

- Cable is an asymmetrical technology
 - Downstream: max 36 Mbps
 - Upstream: max 10 Mbps
- May be reduced to 3 10 Mbps downstream and 2 Mbps upstream, depending on no. of subscribers
- Need a special cable modem

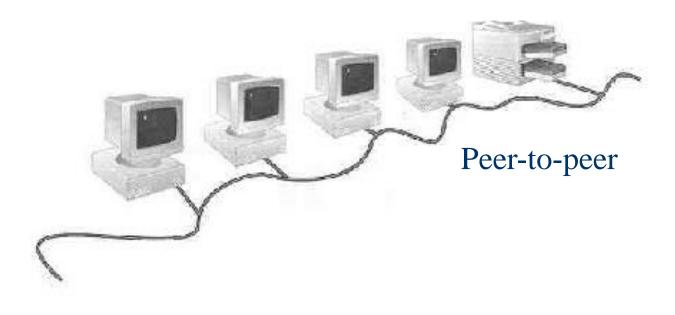

Ethernet

Peer-to-Peer Networks

- Peer-to-peer network is also called workgroup
- No hierarchy among computers ⇒ all are equal
- No administrator responsible for the network

- Advantages of peer-to-peer networks:
 - Low cost
 - Simple to configure
 - User has full accessibility of the computer
- **Disadvantages** of peer-to-peer networks:
 - May have duplication in resources
 - Difficult to uphold security policy
 - Difficult to handle uneven loading
- Where peer-to-peer network is appropriate:
 - 10 or less users
 - No specialized services required
 - Security is not an issue
 - Only limited growth in the foreseeable future

Clients and Servers

- Network Clients (Workstation)
 - Computers that request network resources or services
- Network Servers
 - Computers that manage and provide network resources and services to clients
 - Usually have more processing power, memory and hard disk space than clients
 - Run Network Operating System that can manage not only data, but also users, groups, security, and applications on the network
 - Servers often have a more stringent requirement on its performance and reliability

- Advantages of client/server networks
 - Facilitate resource sharing centrally administrate and control
 - Facilitate system backup and improve fault tolerance
 - Enhance security only administrator can have access to Server
 - Support more users difficult to achieve with peer-topeer networks
- Disadvantages of client/server networks
 - High cost for Servers
 - Need expert to configure the network
 - Introduce a single point of failure to the system

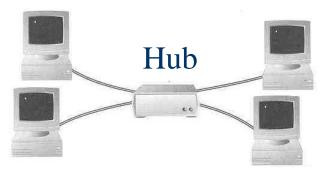

Topology — 3 basic types

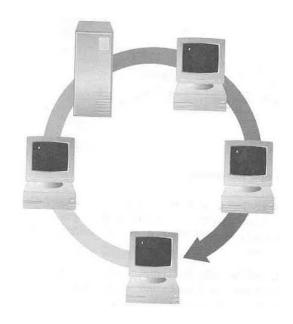

- How so many computers are connected together?
 - **Bus Topology**

Star Topology

Ring Topology

Bus Topology

- Simple and low-cost
- A single cable called a trunk (backbone, segment)
- Only one computer can send messages at a time
- Passive topology computer only listen for, not regenerate data

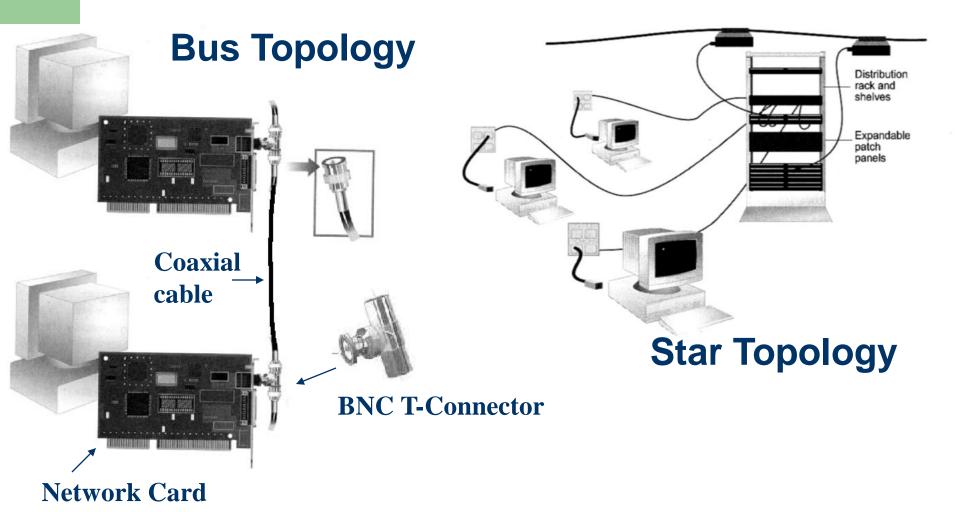

Star Topology

- Each computer has a cable connected to a single point
- More cabling, hence higher cost
- All signals transmission through the hub; if down, entire network down
- Depending on the intelligence of hub, two or more computers may send message at the same time

ENG224 INFORMATION TECHNOLOGY – Part II

5. Introduction to Networking

How to construct a network with Bus / Star Topology?

ENG224 INFORMATION TECHNOLOGY – Part II 5. Introduction to Networking

Ring Topology

- Every computer serves as a repeater to boost signals
- Typical way to send data:
 - Token passing
 - only the computer who gets the token can send data
- Disadvantages
 - Difficult to add computers
 - More expensive
 - If one computer fails, whole network fails
